

Bio-enterprises, Endogenous Development and Wellbeing

Suneetha M Subramanian

UNU-IAS

Defining

- *Community: A group of people in an ecosystem/ landscape undertaking a shared activity and prescribing to common principles*
- *Bio-enterprises : economic activity based on biological resources and ecosystems.*
- *Endogenous development: 'Development from within' led by communities/ proximate stakeholders*
- *Wellbeing: an overall feeling experienced by people as a result of various needs being met.*

Why are we doing this?

- It is acknowledged that most communities depend on biological resources for their livelihoods. *Sustainable use*
- Increasingly these resources are also bringing in augmented incomes through various value added activities, broadly termed as bioenterprises. This could include products or services (ecotourism) . *Beyond sustainable use*
- We would like to know what factors, from the experience of communities, facilitate the development of a successful bio-enterprise activity
- And consequently, how decisions and actions relate to wellbeing goals (*both the Process and the Outcome*)

In the CBD context

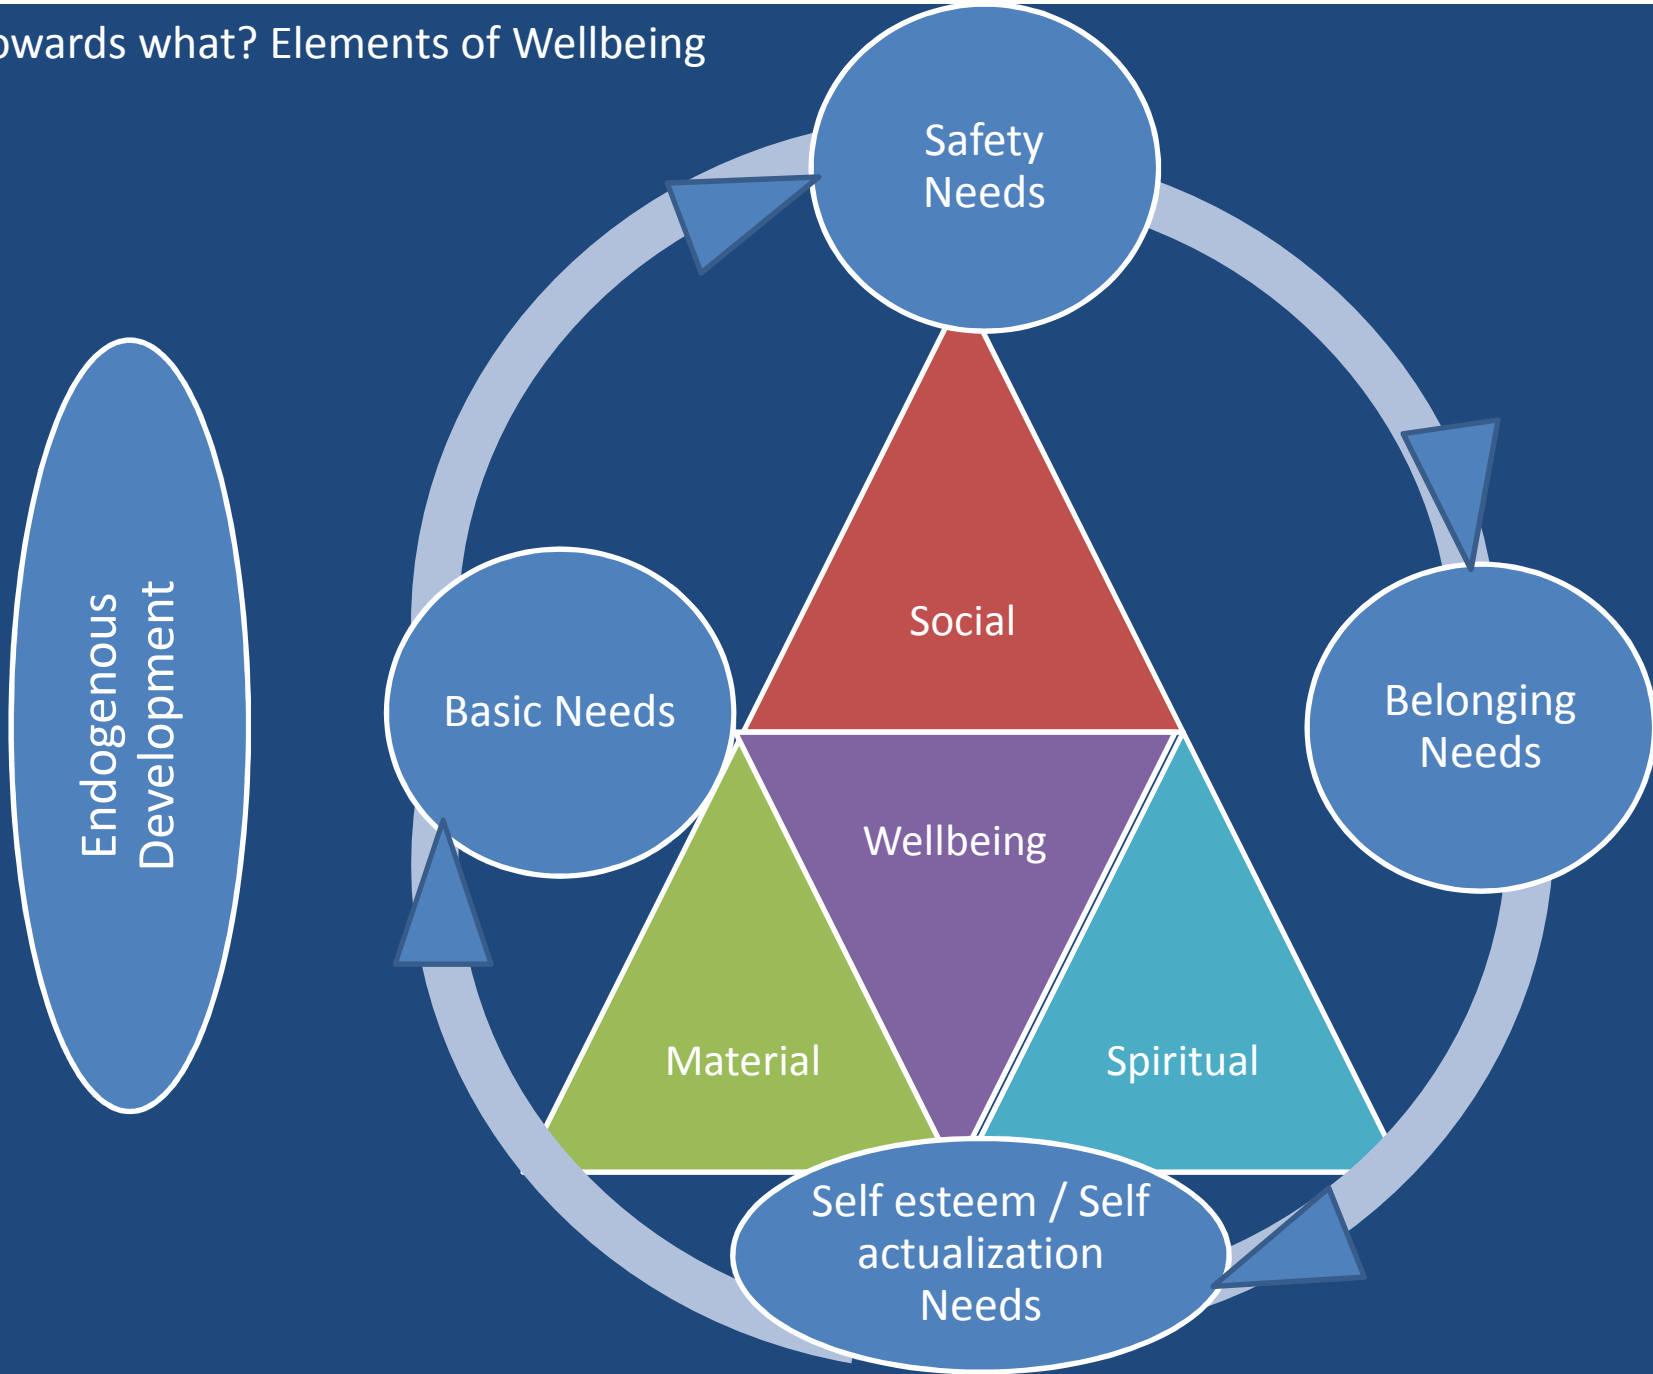

- Sustainable and equitable transactions in the supply chain of a biological resource
- Respectful interactions with communities w.r.t their resources, knowledge, practices and institutions.

Our basis

- From our experience, we believe that the most successful enterprises are those that capitalise on their inherent strengths and resources (*capabilities*) with selective inputs from external agencies . *Endogenous Development process*
- Sen and Nussbaum's *capability framework* and Maslow's '*hierarchy of*' needs and definitions of wellbeing as meeting social, material and spiritual aspirations of people.
- Based on premise that broad based decentralised development possible that actually meets international policy obligations *3 objectives of the CBD and MDGs*

Towards what? Elements of Wellbeing

Measuring changes

Develop indicators and measure changes on parameters

Scores

trends

↑ steep upward trend

↗ slow/some increase

→ No change

↘ slow/some decrease

↓ steep downward

Indicators

- The indicators have been defined in consonance with policy priorities – for instance, Food security.
- However, the framework lets communities define the parameters that result in food security- eg., this could be increase in quantity of food consumed and food buffered- and each community defines what foods (staples) and quantities and quality they consider as appropriate to reflect their security.
- Indicative parameters for each indicator are provided by us, but communities may modify them as appropriate to their milieu.

Indicators

- Hence, it is intended as a dynamic hybrid mechanism that meets objectives at the macro-planning level and facilitates reflection, planning and monitoring at the local level.
- It also allows cross-linking of issues- hence for instance, if food security cannot be met and there is inequity in access to resources or adverse tenure systems- it becomes evident that the first can be solved by addressing the latter – setting a clear context for claims to rights.

Food

Indicator:
improved food
consumption and
capacity to buffer

Account for:
Number of
staples and
approximate
quantity
consumed
and stocked

Basic
Needs

Shelter

Indicator:
improved quality
of houses built

Account for:
Types of
housing and
percentages

Health

Indicator:
improved
access to health
care facilities

Account for:
Types of health
delivery systems
available in the
area, and
number of
people using
them.

Indicator:
improved clarity
of tenure

Account for:
Types of
tenure rights
and number
of people
under each
type.

Indicator:
•Savings
•Alternate
livelihoods
•Insurance

Account for:
Types of
•Savings
•Economic
activities,
•Insurance
schemes

Indicator:
• Types of funds
•Types of
activities

Account for:
Types of
•Community
funds
•Conservation
activities

Indicator:

- 1.Social groups
- Gender equity*
- 2.Women in economic activities
- 3.Women in leadership

Account for:

- 1.Number and type of social groups
- 2.Number of women engaged in different economic activities
- 3.Number of women in leadership positions

Non-discrimination

- 4.Access to resources to all members
- 5.Access to leadership to all members
- 6.Equity in sharing benefits
- 7.Autonomy to regulate/ manage resources

- 4.Resources used, and types of restrictions to use them
- 5.Number of different kinds of stakeholders in the community and representation in leadership of each type
- 6.Prices of major products paid to different stakeholders
- 7.Types of rules to manage resources
- 8.Number of institutions and leaders and the number of followers

Indicator:

Autonomy

- 9. Autonomy in economic activity
- 10. Autonomy in local governance

Account for:

- 9. Type and number of rules to undertake different economic activities
- 10. Types of governance bodies and number of bodies with external representation

Indicator:

- 1.Ability to meet Educational aspirations
- 2.Confidence level

Account for:

1. Number of schools, affordability and number of children getting higher education
2. Types and Number of external partnerships , and number that are still active

Indicator:

Tangible

- 1.Sacred places (natural sites and manmade shrines) protected
- 2.Spiritual leaders and sacred sites custodians exist and perform their roles

Intangible

- 3.Traditional festivals and celebrations secured
- 4.Ability to practice spiritual beliefs and undertake ceremonies

Spiritual
wellbeing

Account for:

Tangible

- 1.Number of sites and people respecting and using them
- 2.Number of spiritual leaders and sacred sites custodians

Intangible

3. Number of festivals and the number of people attending
4. Number of beliefs and ceremonies practiced freely

Initial notes

- Varying Aspirations (of what communities seek to achieve)

Community contexts vary

- Varying Worldviews

Both with mainstream and between community systems

- Autonomy (hierarchies within, between communities and with government/ dominant governance structures)
- Equity (what is equitable in one context not so in others)
- Economy (integration discourses related to monetization; homogenous exchange systems)
- Governance (norms, taboos, customary law and common law)
- Spirituality and 'rootedness' (even if external methods and processes are adopted, cultural norms provide a sense of rootedness that forms basis of interactions)

What does all this indicate?

- WB Assessment results, though from the community context, are also in line with macro indicators.
- Further, such an assessment has the potential to allow holistic planning processes with due emphasis on various interlinked factors that foster community wellbeing

Policy making should take cognizance of

- Facilitated access rights to resources to communities (natural and infrastructural)
- Tangible and intangible rights of communities to manage and use natural resources
- Encourage multistakeholder linkages and co-operative discussions
- Enable appropriate market support considering alternative economies
- Encourage participatory governance systems
- Investing in adequate awareness raising on supportive programmes
- Integration of cultural rootedness and worldviews in formal and informal learning
